# INTERLOCK LEDGER

This package is a python client to the InterlockLedger Node REST API. It connects to InterlockLedger nodes, allowing the creation of chains, interlocks, and storage of records and documents. This client requires the InterlockLedger Node Server version 5.6.61 and API v6.0.0.

## THE INTERLOCKLEDGER

An InterlockLedger network is a peer-to-peer network of nodes. Each node runs the InterlockLedger software. All communication between nodes is point-to-point and digitally signed, but not mandatorily encrypted. This means that data is shared either publicly or on a need-to-know basis, depending on the application.

In the InterlockLedger, the ledger is composed of myriads of independently permissioned chains, comprised of blockchained records of data, under the control of their owners, but that are tied by Interlockings, that avoid them having their content/history being rewritten even by their owners. For each network the ledger is the sum of all chains in the participating nodes.

A chain is a sequential list of records, back chained with signatures/hashes to the previous records, so that no changes in them can go undetected. A record is tied to some enabled Application, that defines the metadata associate with it, and the constraints defined in this public metadata, forcibly stored in the network genesis chain, is akin to validation that each correct implementation of the node software is able to enforce, but more importantly, any external logic can validate the multiple dimensions of validity for records/chains/interlockings/the ledger.

### 1.1 Setting Up the InterlockLedger API client

#### 1.1.1 How to Use

To use the *il2\_rest* package, you can add the *il2\_rest* folder to your project and import the package.

```
>>> import il2_rest as il2
>>> node = il2.RestNode(cert_file = 'documenter.pfx', cert_pass = 'pwd')
```

#### 1.1.2 Installing

The package can also be installed by running the following command on the *setup.py* folder:

```
$ pip3 install .
```

### 1.1.3 Dependencies

The `il2_rest` package was implemented using Python 3.6.9 and requires the following packages:

- colour (0.1.5)
- packaging (19.2)
- pyOpenSSL (19.1.0)
- requests (2.22.0)
- uri (2.0.1)
- pylint (0.2.0)

## 1.2 Quickstart Tutorial

### 1.2.1 The Basics

To use the `il2_rest` client, you need to create an instance of the `RestNode` by passing a certificate file and the address of the node (default value is `localhost`).

---

**Note:** The certificate must be already imported to the InterlockLedger node and be permissioned on the desired chain. See the InterlockLedger node manual.

---

With the `RestNode` class, it is possible to retrieve details of the node, such as the list of valid apps in the network, peers, mirrors and chains.

```
>>> import il2_rest as il2
>>>
>>> node = il2.RestNode(cert_file='documenter.pfx', cert_pass='password', address=
↳ 'your.node.address', port=32020)
>>> print(node.details)
Node 'Node for il2tester on Apollo' Node!qh8D-FVQ8-2ng_EIDN8C9m3pOLAtz0BXKuCh9OBD6U
Running il2 node#3.6.0 using [Message Envelope Wire Format #1] with Peer2Peer#2.1.0
Network Apollo
Color #20f9c7
Owner il2tester #Owner!yj...<REDACTED>...zk
Roles: Interlocking,Mirror,PeerRegistry,Relay,User
Chains: 20i...<REDACTED>..._fc, 5rA...<REDACTED>...Pso
```

To see and store records and documents, you need to use an instance of the `RestChain`. You can get `RestChain` instances by retrieving the list of chains in the network:

```
>>> for chain in node.chains:
...     print(chain)
...
Chain 'My first chain' #cA7CTUJxkcpGMpuGtg59kB9z5B1lR-gQ4k4xBn8VAuo
Chain 'Second chain' #5rA_Fp9mhn3jb26G2Lsue5gWjxUdjLIWAs8Xvkg5Pso
Chain '3.6.2 chain name' #A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE
```

Or by its chain id:

```
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> print(chain)
Chain '3.6.2 chain name' #A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE
```

Besides retrieving and storing records and documents, the `RestChain` class also allows to manage the active apps in the chain, see/permit keys, and do interlocks.

## 1.2.2 Storing JSON Documents

The JSON Documents App allows you to store a custom JSON:

```
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> json_data = {
...     "field1" : 1,
...     "field2" : "Test",
...     "field3": [1,2,3],
...     "field4" : {
...         "value1" : 10,
...         "value2" : 20
...     }
... }
>>> new_json_document = chain.chain.store_json_document(json_data)
>>> print(new_json_document)
```

## 1.2.3 Storing Multi-Documents

It is possible to store multiple documents in a single record of a chain. First you will need to begin a transaction:

```
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> resp = chain.documents_begin_transaction(comment = 'Using parameters')
>>> transaction_id = resp.transactionId
```

Then, you can add as many files you wish using the transaction id:

```
>>> chain.documents_transaction_add_item(transaction_id, "item1.txt", "./test.txt",
↳ "text/plain")
>>> chain.documents_transaction_add_item(transaction_id, "item2.txt", "./test2.txt",
↳ "text/plain", "This file has a comment.")
```

When you are done, all you need to do is commit the transaction:

```
>>> locator = chain.documents_transaction_commit(transaction_id)
```

To download the files stored in a chain, you will need to use the locator of a multi-document record. You can store a single file of a multi-document record using the index of the file in the record:

```
>>> chain.download_single_document_at(locator, 0, '/path/to/download/')
```

Or you can download all files in a compressed in a single file:

```
>>> chain.download_documents_as_zip(locator, '/path/to/download/')
```

## 1.2.4 Managing Keys

You can see the list of keys permitted in the chain by using the following script:

```
>>> for key in chain.permitted_keys :
...     print(key)
...
Key 'emergency!AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE' Key!-
↳bLg6Sklpj3Bhnn8A7VXkGnyED2oWHn9AhjpKiPL7sK0
  Purposes: [Protocol,Action]
  Actions permitted:
    App #0 Action 131
Key 'manager!AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE' Key!
↳QX5JpVthlQ5acCf3x05gCFyc5HEHQQwsbwnJDXyVROM
  Purposes: [Protocol,Action,KeyManagement]
  Actions permitted:
    App #2 Actions 500,501
    App #1 Actions 300,301
```

If you are using a certificate allowed to permit keys, you can permit other key in the chain:

---

**Note:** To permit other keys, the certificate must be already imported to the Interlockledger node with actions for App #2 and actions 500,501.

---

```
>>> from il2_rest.models import KeyPermitModel
>>> key_model = KeyPermitModel(app=4, appActions=[1000, 1001], key_id='Key!
↳MJ0kidltB324mfkiOG0aBlEocPA#SHA1',
...     name='documenter', publicKey='PubKey!KpgQEPgItqh<...REDACTED...>
↳BZk4axWhFbTDrxADAQAB#RSA',
...     purposes=[KeyPurpose.Action, KeyPurpose.Protocol])
>>> keys = chain.permit_keys([key_model])
>>> for key in keys :
...     print(keys)
...
Key 'emergency!AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE' Key!-
↳bLg6Sklpj3Bhnn8A7VXkGnyED2oWHn9AhjpKiPL7sK0
  Purposes: [Protocol,Action]
  Actions permitted:
    App #0 Action 131
Key 'manager!AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE' Key!
↳QX5JpVthlQ5acCf3x05gCFyc5HEHQQwsbwnJDXyVROM
  Purposes: [Protocol,Action,KeyManagement]
  Actions permitted:
    App #2 Actions 500,501
    App #1 Actions 300,301
Key 'documenter' Key!MJ0kidltB324mfkiOG0aBlEocPA#SHA1
  Purposes: [Action,Protocol]
  Actions permitted:
    App #4 Actions 1000,1001
```

## 1.2.5 Permitting Apps

To check the active apps in the chain:

```
>>> print(chain.active_apps)
[0, 1, 2, 3, 5]
```

To permit new apps:

```
>>> apps = chain.permit_apps([4])
>>> print(apps)
[4]
```

## 1.2.6 Forcing Interlocks

The Interlocking is one of the concepts that grant immutability in IL2. They are made automatically by the network, this way there is no need for your application to worry about them. However, if you need to force an Interlocking, you can use the following code:

```
>>> from il2_rest.models import ForceInterlockModel
>>> force_model = ForceInterlockModel(targetChain=
↳ 'or7lzOG0vzH3GeNUTPqJI41CY0rVcEWgw6IEBmSSDxI')
>>> interlock_model = chain.force_interlock(model=force_model)
Interlocked chain or7lzOG0vzH3GeNUTPqJI41CY0rVcEWgw6IEBmSSDxI at record #11 (offset:
↳ 14308) with hash aneZJyR81OiqFzoQ0px4ZDFRCSNS9LzxbGUNueQKAtg#SHA256
```

If you need to check the interlockings of a chain:

```
>>> for interlock in chain.interlocks().items :
...     print(interlock)
```

## 1.3 The il2\_rest package

This reference manual details the functions, modules and objects included in the *il2\_rest* API.

### 1.3.1 Client module

This module has the classes needed to connect and communicate with the InterlockLedger REST API.

#### 1.3.1.1 RestChain

```
class il2_rest.client.RestChain(rest, chainId, **kwargs)
    Bases: object
```

REST API client to the InterlockLedger chain.

*Note:* It is not recommended to create an instance of *RestChain* outside of an instance of *RestNode*.

#### Parameters

- **rest** (*RestNode*) – Instance of the node.
- **chainId** (*il2\_rest.models.ChainIdModel*) – Chain model.

**id**  
Chain id.  
**Type** `str`

**name**  
Chain name.  
**Type** `str`

**licensingStatus**  
Licensing status.  
**Type** `str`

**property active\_apps**  
Enumerate apps that are currently permitted on this chain.  
**Type** `list of int`

**add\_record(model)**  
Add a new record.  
**Parameters** **model** (`il2_rest.models.NewRecordModel`) – Model with the description of the new record.  
**Returns** Added record information.  
**Return type** `il2_rest.models.RecordModel`

### Example

```
>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_
↳ = 32020)
>>> chain = node.chain_by_id('cRPeHOITV_t1ZQS9CIL7Yi3djJ33ynZCdSRsEnOvX40')
>>> model = NewRecordModel(applicationId = 1, payloadTagId = 300,
...                          payloadBytes = bytes([248, 52, 7, 5, 0, 0, 20, 2, 1, 4]))
>>> record = chain.add_record(model)
>>> print(record)
{
  "applicationId": 1,
  "chainId": "cRPeHOITV_t1ZQS9CIL7Yi3djJ33ynZCdSRsEnOvX40",
  "createdAt": "2020-02-13T18:59:50.9033962-03:00",
  "hash": "mAwajCPH1c369GZLLXWsd_E7WkkZ2tdLS3LsZWbCPnw#SHA256",
  "payloadTagId": 300,
  "serial": 4,
  "type": "Data",
  "version": 2,
  "payloadBytes": "+DQHBQAAFAIBBA=="
}
```

**add\_record\_as\_json(applicationId=None, payloadTagId=None, payload=None, rec\_type=<RecordType.Data: 'Data'>, model=None)**

Add a new record with a payload encoded as JSON. The JSON value will be mapped to the payload tagged format as described by the metadata associated with the payloadTagId

#### Parameters

- **applicationId** (`int`) – Application id of the record.
- **payloadTagId** (`int`) – Payload tag id of the record.

- **payload** (int) – Payload data encoded as json
- **rec\_type** (*il2\_rest.enumerations.RecordType*) – Type of record.
- **model** (*il2\_rest.models.NewRecordModelAsJson*) – Model with the description of the new record as JSON. **NOTE:** if model is not None, the other arguments will be ignored.

**Returns** Added record information.

**Return type** *il2\_rest.models.RecordModel*

### Example

```
>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_
↳ = 32020)
>>> chain = node.chain_by_id('tdiy2HnWv-4a_h5T4Xy8l93CQ0lVkJeu2r5qgSlALMY')
>>> model = NewRecordModelAsJson(applicationId = 1, payloadTagId = 300, rec_
↳ json= {'tagId': 300, 'version' : 0, 'apps': [4]})
>>> record = chain.add_record_as_json(model = model)
>>> print(record)
{
  "applicationId": 1,
  "chainId": "tdiy2HnWv-4a_h5T4Xy8l93CQ0lVkJeu2r5qgSlALMY",
  "createdAt": "2020-02-13T18:56:44.3002447-03:00",
  "hash": "Y8Xb9FpTkgxj38xlwzcaZXm8fUq-NYxODVcyOQtzJ3c#SHA256",
  "payloadTagId": 300,
  "serial": 4,
  "type": "Data",
  "version": 2,
  "payload": {
    "tagId": 300,
    "version": 0,
    "apps": [
      4
    ]
  }
}
```

**add\_record\_unpacked** (*applicationId*, *payloadTagId*, *rec\_bytes*, *rec\_type*=<*RecordType.Data*:  
'Data'>)

Add a new record with an unpacked payload. Payload inner bytes **MUST** go in the body, in binary form. These inner bytes will be prefixed with the payloadTagId and the length, both encoded as ILInt, as required to assemble the record effective payload.

#### Parameters

- **applicationId** (int) – Application id of the record.
- **payloadTagId** (int) – Payload tag id of the record.
- **rec\_type** (*il2\_rest.enumerations.RecordType*) – Type of record.
- **rec\_bytes** (bytes) – Payload bytes.

**Returns** Added record information.

**Return type** *il2\_rest.models.RecordModel*

### Example

```
>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_
↳= 32020)
>>> chain = node.chain_by_id('VzCJczfgBeIiIBlnTRbmtsPriqwrkHqtF2yt8nhTcjM')
>>> record = chain.add_record_unpacked(applicationId = 1, payloadTagId = 300,
↳rec_bytes = bytes([5, 0, 0, 20, 2, 1, 4]))
>>> print(record)
{
  "applicationId": 1,
  "chainId": "VzCJczfgBeIiIBlnTRbmtsPriqwrkHqtF2yt8nhTcjM",
  "createdAt": "2020-02-13T19:01:37.5175345-03:00",
  "hash": "cY7krS7BSJcBi7Ickq-u4iI6V6lYoKULfQtEZGJ-mC0#SHA256",
  "payloadTagId": 300,
  "serial": 4,
  "type": "Data",
  "version": 2,
  "payloadBytes": "+DQHBQAAFAIBBA=="
}
```

**documents\_begin\_transaction** (*comment=None, compression=None, generatePublicDirectory=None, iterations=None, encryption=None, password=None, model=None*)

Begin a transaction to store a set of documents. May rollback on timeout or errors.

#### Parameters

- **comment** (*str*) – Any additional information about the set of documents to be stored.
- **compression** (*il2\_rest.enumerations.DocumentsCompression*) – Compression algorithm. The compression algorithm can be as follows:
  - NONE: No compression. Simply store the bytes;
  - GZIP: Compression of the data using the gzip standard;
  - BROTLI: Compression of the data using the brotli standard;
  - ZSTD: Compression of the data using the ZStandard from Facebook (In the future).
- **generatePublicDirectory** (*bool*) – If the publically viewable PublicDirectory field should be created.
- **iterations** (*int*) – Override for the number of PBE iterations to generate the key.
- **encryption** (*str*) – The encryption descriptor in the <pbe>-<hash>-<cipher>-<level> format Examples:
  - "PBKDF2-SHA256-AES256-LOW"
  - "PBKDF2-SHA512-AES256-MID"
  - "PBKDF2-SHA256-AES128-HIGH"
- **password** (*bytes*) – Password as bytes if Encryption is not null.
- **model** (*il2\_rest.models.DocumentsBeginTransactionModel, optional*) –

**Returns** Started transaction identifier and limits.

**Return type** *il2\_rest.models.DocumentsTransactionModel*

## Examples

Begin transaction using a `il2_rest.models.DocumentsBeginTransactionModel`:

```
>>> from il2_rest.models import DocumentsBeginTransactionModel
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> model = DocumentsBeginTransactionModel(chain = 'EbAfcWGwCwzuiEtSwIwYQYIH-
↳g05CZl6jrcBAYuYRI',
...                                     comment = 'Using model')
>>> resp = chain.documents_transaction_metadata('EbAfcWGwCwzuiEtSwIwYQYIH-
↳g05CZl6jrcBAYuYRIe')
>>> print(resp)
```

The same can be done passing all the information as parameters:

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> resp = chain.documents_begin_transaction(comment = 'Using parameters')
>>> print(resp)
```

**documents\_transaction\_add\_item**(*transaction\_id*, *name*, *filepath*, *content\_type*=None, *comment*=None)

Adds another document to a pending transaction of multi-documents.

### Parameters

- **transaction\_id** (str) – Id of the ongoing transaction.
- **name** (str) – File name.
- **filepath** (str) – Path to the file to upload.
- **content\_type** (str, optional) – File mime-type. If None, it will try to guess the mime-type based on the file extension.
- **comment** (str, optional) – Additional comment.

**Returns** True if success

**Return type** bool

## Example

```
After beginning a transaction, you can add as many items as you wish:
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> resp = chain.documents_begin_transaction(comment = 'Using parameters')
>>> transaction_id = resp.transactionId
>>> chain.documents_transaction_add_item(transaction_id, "item1.txt", "/test.txt")
>>> chain.documents_transaction_add_item(transaction_id, "item2.txt", "/test2.txt", comment = "This
file has a comment.")
```

**documents\_transaction\_commit**(*transaction\_id*)

Store set of uploaded documents.

*Note:* Rementer to save the locator after committing.

**Parameters** **transaction\_id** (str) – Id of the ongoing transaction.

**Returns** Documents storage locator.

**Return type** `str`

### Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> resp = chain.documents_begin_transaction(comment = 'Using parameters')
>>> transaction_id = resp.transactionId
>>> chain.documents_transaction_add_item(transaction_id, "item1.txt", "text/
↳plain", "./test.txt")
>>> chain.documents_transaction_add_item(transaction_id, "item2.txt", "text/
↳plain", "./test2.txt", "This file has a comment.")
>>> locator = chain.documents_transaction_commit(transaction_id)
```

### **documents\_transaction\_metadata** (*locator*)

Retrieve the metadata for the set of documents from chain.

**Parameters** **locator** (`str`) – A Documents Storage Locator.

**Returns** Metadata associated to a Multi-Document Storage Locator

**Return type** `il2_rest.models.DocumentsMetadataModel`

### Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> resp = chain.documents_transaction_metadata('EbAfcWGwCwzuiEtSwIwYQYIH-
↳g05CZl6jrcBAYuYRIe')
>>> print(resp)
```

### **documents\_transaction\_status** (*transaction\_id*)

Get the ongoing status of a transaction.

**Parameters** **transaction\_id** (`str`) – Id of the transaction.

**Returns** Transaction identifier and limits.

**Return type** `il2_rest.models.DocumentsTransactionModel`

### Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> resp = chain.documents_transaction_status('IZqVW6p7z4hVdWzv')
>>> print(resp)
```

### **download\_documents\_as\_zip** (*locator*, *dst\_path*='.')

Download a compressed file with all documents to a folder (default: current folder).

**Parameters**

- **locator** (`str`) – A Documents Storage Locator.
- **dst\_path** (`str`) – Download the file to this folder.

### Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> chain.download_documents_as_zip('EbAfcWGwCwzuiEtSwIwQYIHhy-
↳g05CZl6jrcBAYuYRIe', '/path/to/download/')
```

**download\_single\_document\_at** (*locator, index, dst\_path='./'*)

Download document by position from the set of documents to a folder (default: current folder).

#### Parameters

- **locator** (str) – A Documents Storage Locator.
- **index** (int) – Index of the file.
- **dst\_path** (str) – Download the file to this folder.

### Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> chain.download_single_document_at('EbAfcWGwCwzuiEtSwIwQYIHhy-
↳g05CZl6jrcBAYuYRIe', 0, '/path/to/download/')
```

**force\_interlock** (*model*)

Forces an interlock on a target chain.

**Parameters** **model** (*il2\_rest.models.ForceInterlockModel*) – Force interlock command details.

**Returns** Interlocking details.

**Return type** *il2\_rest.models.InterlockingRecordModel*

### Example

```
>>> node = RestNode(cert_file = 'mykeymanager.pfx', cert_pass = 'password',
↳port = 32020)
>>> chain = node.chain_by_id('VzCJczfgBeIiIBlnTRbmtsPriqwrkHqtF2yt8nhTcjM')
>>> model = ForceInterlockModel(targetChain = '8fox30W54ZkzM-shfUeU5C7ad-
↳fsf5nICwNpkCUk5w')
>>> interlocks = chain.force_interlock(model)
>>> for il in interlocks :
...     print(il)
...
Interlocked chain 8fox30W54ZkzM-shfUeU5C7ad-_fsf5nICwNpkCUk5w at record #14

  }

```

**interlocks** (*howManyFromLast=0, page=0, pageSize=10*)

Get list of interlocks registered for the chain.

**Parameters**

- **howManyFromLast** (int) – How many interlocking records to return. If omitted or 0 returns all.
- **page** (int) – Page to return.
- **pageSize** (int) – Number of items per page. If 0 returns all.

**Returns** List of interlocks registered in the chain.**Return type** `il2_rest.models.PageOfModel` of `il2_rest.models.InterlockingRecordModel`**json\_document\_at** (*serial*)

Get a specific JSON document stored in the chain. :param serial: Serial number of the record. :type serial: int

**Returns** JSON document record.**Return type** `il2_rest.models.JsonDocumentRecordModel`**permit\_apps** (*apps\_to\_permit*)

Add apps to the permitted list for the chain.

**Parameters** **apps\_to\_permit** (list of int) – List of apps (by number) to be permitted.**Returns** Enumerate apps that are currently permitted on this chain.**Return type** list of int**Example**

```

>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_
    ↪= 32020)
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> apps = chain.permit_apps([4])
>>> print(apps)
[4]

```

**permit\_keys** (*keys\_to\_permit*)

Add keys to the permitted list for the chain.

**Parameters** **keys\_to\_permit** (list of `il2_rest.models.KeyPermitModel`) – List of keys to permitted.**Returns** Enumerate keys that are currently permitted on chain.**Return type** list of `il2_rest.models.KeyModel`

### Example

```

>>> node = RestNode(cert_file = 'mykeymanager.pfx', cert_pass = 'password',
↳port = 32020)
>>> chain = node.chain_by_id('20ic_KPTCIDfrlwQPKBHdKKp1a6ADaFtBvBjvFmf_fc')

App #1 Actions 300, 301

```

#### property permitted\_keys

Enumerate keys that are currently permitted on chain.

**Type** list of `il2_rest.models.KeyModel`

#### record\_at (serial)

Get an specific record.

**Parameters** **serial** (int) – Record serial number.

**Returns** Record with the specific serial number.

**Return type** `il2_rest.models.RecordModel`

#### record\_at\_as\_json (serial)

Get an specific record with payload mapped to json.

**Parameters** **serial** (int) – Record serial number.

**Returns** Record mapped to JSON with the specific serial number.

**Return type** `il2_rest.models.RecordModelAsJson`

**records** (*firstSerial=None, lastSerial=None, page=0, pageSize=10, lastToFirst=False*)

Get list of records starting from a given serial number.

**Parameters**

- **firstSerial** (int, optional) – Starting serial number.
- **lastSerial** (int, optional) – Last serial number.
- **page** (int, optional) – Page to return (Default is 0).
- **pageSize** (int, optional) – Number of items per page (Default is 10). If 0 returns all.
- **lastToFirst** (int, optional) – If True, return the list of records in reverse order (Default is False).

**Returns** List of records in the given interval.

**Return type** `il2_rest.models.PageOfModel` of `il2_rest.models.RecordModel`

**records\_as\_json** (*firstSerial=None, lastSerial=None, page=0, pageSize=10, lastToFirst=False*)

Get list of records with payload mapped to JSON starting from a given serial number.

**Parameters**

- **firstSerial** (int, optional) – Starting serial number.
- **lastSerial** (int, optional) – Last serial number.
- **page** (int, optional) – Page to return (Default is 0).
- **pageSize** (int, optional) – Number of items per page (Default is 10). If 0 returns all.
- **lastToFirst** (int, optional) – If True, return the list of records in reverse order (Default is False).

**Returns** List of records mapped to JSON in the given interval.

**Return type** `il2_rest.models.PageOfModel` of `il2_rest.models.RecordModelAsJson`

**store\_json\_document** (*payload*)

Store a JSON document record.

**Parameters** **payload** (dict) – A valid JSON.

**Returns** Added JSON document details.

**Return type** `il2_rest.models.JsonDocumentRecordModel`

### Example

```

>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> json_data = {
...     "field1" : 1,
...     "field2" : "Test",
...     "field3": [1,2,3],
...     "field4" : {
...         "value1" : 10,
...         "value2" : 20
...     }
... }
>>> new_json_document = chain.chain.store_json_document(json_data)
>>> print(new_json_document)

```

#### property summary

Chain details

Type `il2_rest.models.ChainSummaryModel`

### 1.3.1.2 RestNetwork

**class** `il2_rest.client.RestNetwork` (*rest*)

Bases: `object`

Informations about the node network.

**Parameters** *rest* (`RestNode`) – Node of the network.

#### property apps

List of valid apps in the network.

Type `AppsModel`

### 1.3.1.3 RestNode

**class** `il2_rest.client.RestNode` (*cert\_file*, *cert\_pass*, *port=32032*, *address='localhost'*, *verify\_ca=True*)

Bases: `object`

REST API client to the InterlockLedger node.

You'll try to establish a bi-authenticated https connection with the configured node API address and port. The client-side certificate used to connect needs to be configured with the proper layered authorization role in the node configuration file and imported into a key permitted to update the chain that will be used.

#### Parameters

- **cert\_file** (`str`) – Path to the .pfx certificate. Please refer to the InterlockLedger manual to see how to create and import the certificate into the node.
- **cert\_pass** (`str`) – Password of the .pfx certificate.
- **port** (`int`) – Port number to connect.
- **address** (`str`) – Address of the node.
- **verify\_ca** (`bool`) – If True, checks CA.

**base\_uri**

The base URI address of the node.

**Type** `uri.URI`

**network**

Network information client.

**Type** `RestNetwork`

**add\_mirrors\_of** (*new\_mirrors*)

Add new mirrors in this node.

**Parameters** **new\_mirrors** (list of str) – List of chain ids you want to mirror.

**Returns** List of the chain information.

**Return type** list of `il2_rest.models.ChainIdModel`

**property api\_version**

IL2 API version.

**Type** `str`

**property certificate\_name**

Certificate friendly name.

**Type** `str`

**chain\_by\_id** (*chain\_id*)

Get a chain by id.

**Parameters** **chain\_id** (str) – Chain id.

**Returns** Chain instance with the corresponding id.

**Return type** `RestChain`

**Example**

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password',
↳port = 32020)
>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> print(chain)
Chain '3.6.2 chain name' #A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE
```

**property chains**

List of chain instances.

**Type** list of `RestChain`

**create\_chain** (*model*)

Create a new chain.

**Parameters** **model** (`il2_rest.models.ChainCreationModel`) – Model with the new chain attributes.

**Returns** Chain created model.

**Return type** `il2_rest.models.ChainCreatedModel`

### Example

```
>>> node = RestNode(cert_file = 'admin.pfx', cert_pass = 'password', port = 32020)
>>> new_chain = ChainCreationModel(name = 'New chain name', description = 'New chain',
...     managementKeyPassword = 'keyPassword',
...     emergencyClosingKeyPassword = 'closingPassword')
>>> resp = node.create_chain(new_chain)
>>> print(resp)
Chain 'New chain name' #cRPeHOITV_t1ZQS9CIL7Yi3djJ33ynZCdSRsEnOvX40
```

#### property details

Get node details.

Type `il2_rest.models.NodeDetailsModel`

#### property documents\_config

Get documents upload configuration.

Type `il2_rest.models.DocumentUploadConfigurationModel`

#### interlocks\_of(chain)

Get the list of interlocking records pointing to a target chain instance.

Parameters **chain** (str) – Chain id.

Returns List of interlockings.

Return type list of `il2_rest.models.InterlockingRecordModel`

### Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> interlocks = node.interlocks_of('8fox30W54ZkzM-shfUeU5C7ad-_fsf5nICwNpkCUk5w')
>>> for interlock in interlocks :
...     print(interlock)
...
Interlocked chain 8fox30W54ZkzM-shfUeU5C7ad-_fsf5nICwNpkCUk5w at record #14
(offset: 13671) with hash RyvOZIjnoUG4QX7FwQs3f6BqDfnOPb3txgXJNxLxtDo#SHA256
{
    "applicationId": 3,
    "chainId": "A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-idKE",
    "createdAt": "2020-02-26T23:17:03.018975-03:75",

    "interlockedRecordOffset": 13671,
    "interlockedRecordSerial": 14
}
```

**property mirrors**

Get list of mirrors instances.

**Type** list of *RestChain*

**property peers**

Get list of known peers.

**Type** list of *il2\_rest.models.PeerModel*

## 1.3.2 Models module

Resource models available in the InterlockLedger REST API.

### 1.3.2.1 CustomEncoder

```
class il2_rest.models.CustomEncoder (*, skipkeys=False, ensure_ascii=True,  
                                     check_circular=True, allow_nan=True,  
                                     sort_keys=False, indent=None, separators=None,  
                                     default=None)
```

Bases: `json.encoder.JSONEncoder`

Custom JSON encoder for the IL2 REST API models.

**default** (*obj*)

Set the behavior of the encoder depending on the type of obj.

### 1.3.2.2 BaseModel

```
class il2_rest.models.BaseModel
```

Bases: `object`

Base class for all models.

```
classmethod from_json (json_data)
```

Convert a dict (JSON like) to a *BaseModel* object.

**Parameters** *json\_data* (`dict`) – JSON object to be converted.

**Returns** return an instance of the JSON model.

**Return type** *BaseModel*

```
json (hide_null=True, return_as_str=False)
```

Convert a *BaseModel* class to a dict (JSON like).

**Parameters**

- **hide\_null** (`bool`, optional) – If True, discards every item (key, value) where value is None.
- **return\_as\_str** (`bool`, optional) – If True, return the JSON as a string instead of a dict.

**Returns** return obj as a JSON

**Return type** `dict/str`

```
classmethod to_json (obj, hide_null=True, return_as_str=False)
```

Convert an object to a dict (JSON like).

**Parameters**

- **obj** (list/dict/*BaseModel*) – Object to be converted to JSON.
- **hide\_null** (bool, optional) – If True, discards every item (key, value) where value is None.
- **return\_as\_str** (bool, optional) – If True, return the JSON as a string instead of a dict.

**Returns** return obj as a JSON

**Return type** dict/str

**1.3.2.3 AppsModel**

**class** `il2_rest.models.AppsModel` (*network=None, validApps=[], \*\*kwargs*)

Bases: `il2_rest.models.BaseModel`

Details of the InterlockApps available in the chain.

**Parameters**

- **network** (str) – Network name.
- **validApps** (list of *PublishedApp*/list of dict) – List of currently valid apps for this network.
- **\*\*kwargs** – Arbitrary keyword arguments.

**network**

Network name

**Type** str

**validApps**

Currently valid apps for this network

**Type** list of *PublishedApp*

**class** `PublishedApp` (*alternativeId=None, appVersion=None, description=None, app\_id=None, name=None, publisherId=None, dataModels=None, publisherName=None, reservedILTagIds=None, simplifiedHashCode=None, start=None, version=None, \*\*kwargs*)

Bases: `il2_rest.models.BaseModel`

InterlockApp permitted in the chain.

**alternativeId**

Alternative id for the application.

**Type** int

**appVersion**

Application semantic version, with four numeric parts.

**Type** *version*

**description**

Description of the application.

**Type** str

**id**

Unique id for the application.

**Type** int

**name**

Application name.

**Type** `str`

**publisherId**

Publisher id, which is the identifier for the key the publisher uses to sign the workflow requests in its own chain. It should match the PublisherName

**Type** `str`

**publisherName**

Publisher name as registered in the Genesis chain of the network.

**Type** `str`

**dataModels**

The list of data models for the payloads of the records stored in the chains.

**Type** list of *DataModel*

**reservedILTagIds**

The list of ranges of ILTagIds to reserve for the application.

**Type** list of *il2\_rest.util.LimitedRange*

**simplifiedHashCode**

Hash code.

**Type** `int`

**start**

The start date for the validity of the app, but if prior to the effective publication of the app will be overridden with the publication date and time. If a string is passed, it will be automatically converted to `datetime.datetime`, as long as the string is in the 'yyyy-mm-ddTHH:MM:SS+HH:MM' format.

**Type** `datetime.datetime/str`

**version**

Version of the application.

**Type** `int`

**alternativeId**

Alternative id for the application.

**Type** `int`

**appVersion**

Application semantic version, with four numeric parts.

**Type** *version*

**description**

Description of the application.

**Type** `str`

**id**

Unique id for the application.

**Type** `int`

**name**

Application name.

**Type** `str`

**publisherId**

Publisher id, which is the identifier for the key the publisher uses to sign the workflow requests in its own chain. It should match the PublisherName

**Type** `str`

**publisherName**

Publisher name as registered in the Genesis chain of the network.

**Type** `str`

**dataModels**

The list of data models for the payloads of the records stored in the chains.

**Type** list of *DataModel*

**reservedILTagIds**

The list of ranges of ILTagIds to reserve for the application.

**Type** list of *il2\_rest.util.LimitedRange*

**simplifiedHashCode**

Hash code.

**Type** `int`

**start**

The start date for the validity of the app, but if prior to the effective publication of the app will be overridden with the publication date and time.

**Type** `datetime.datetime`

**version**

Version of the application.

**Type** `int`

**\_\_eq\_\_** (*other*)

bool: Return True if self and other have the same id and appVersion.

**\_\_lt\_\_** (*other*)

bool: Return self.id < other.id. If self and other have the same id, return self.appVersion < other.appVersion.

**\_\_str\_\_** ()

str: String representation of the published app.

**property compositeName**

Concatenation of the App's publisher name, name and version.

**Type** `str`

### 1.3.2.4 AppPermissions

**class** `il2_rest.models.AppPermissions` (*appId=None, actionIds=[], \*\*kwargs*)

Bases: *il2\_rest.models.BaseModel*

App permissions

**appId**

App to be permitted (by number)

**Type** `int`

**actionIds**

App actions to be permitted by number.

**Type** list of `int`

**\_\_str\_\_** ()

str: String representation of app permissions.

**classmethod** `from_str` (*permissions*)

Parse a string into an *AppPermissions* object.

**Parameters** **permissions** (*str*) – App permissions in the format used by the JSON response (`'#<appId>,<actionId_1>,...,<actionId_n>'`).

**Returns** return an *AppPermissions* instance.

**Return type** *AppPermissions*

**to\_str()**  
*str*: String representation of app permissions in the JSON format (`'#<appId>,<actionId_1>,...,<actionId_n>'`).

### 1.3.2.5 DataModel

**class** *il2\_rest.models.DataModel* (*description=None, dataFields=None, indexes=None, payloadName=None, payloadTagId=None, version=None, \*\*kwargs*)

Bases: *il2\_rest.models.BaseModel*

Data model for the payloads and actions for the records the application stores in the chains.

**description**

Description of the data model.

**Type** *str*

**dataFields**

The list of data fields.

**Type** list of *DataModel.DataFieldModel*

**indexes**

List of indexes for records of this type.

**Type** list of *DataModel.DataIndexModel*

**payloadName**

Name of the record model.

**Type** *str*

**payloadTagId**

Tag id for this payload type. It must be a number in the reserved ranges.

**Type** *int*

**version**

Version of this data model, should start from 1.

**Type** *int*

**class** *DataFieldModel* (*cast=None, elementTagId=None, isOpaque=None, isOptional=None, description=None, Enumeration=None, enumerationAsFlags=None, name=None, serializationVersion=None, subDataFields=None, tagId=None, version=None, \*\*kwargs*)

Bases: *il2\_rest.models.BaseModel*

Metadata for field definition.

**cast**

Type of the data field.

**Type** *il2\_rest.enumerations.DataFieldCast*

**elementTagId**

The type of the field in case it is an array.

**Type** *int*

**isOpaque**  
If `True` the field is stored in raw bytes.  
**Type** `bool`

**isOptional**  
Indicate if data field is optional.  
**Type** `bool`

**name**  
Name of the data field.  
**Type** `str`

**serializationVersion**  
Data field definition version.  
**Type** `int`

**subDataFields**  
If the data field is composed of more fields, indicates the metadata of the subdata fields.  
**Type** list of `DataModel.DataFieldModel`

**tagId**  
Type of the field. (see tags in the InterlockLedger node documentation)  
**Type** `int`

**version**  
Version of the data field.  
**Type** `int`

**class DataIndexModel** (*elements=None, isUnique=None, name=None, \*\*kwargs*)  
Bases: `il2_rest.models.BaseModel`  
Index of the data model.

**elements**  
Elements of the index.  
**Type** list of `DataModel.DataIndexModel.DataIndexElementModel`

**isUnique**  
Indicate if the data field is unique.  
**Type** `bool`

**name**  
Name of the index.  
**Type** `str`

**class DataIndexElementModel** (*descendingOrder=None, fieldPath=None, function=None, \*\*kwargs*)  
Bases: `il2_rest.models.BaseModel`  
Data index element.

**descendingOrder**  
Indicate if the field is ordered in descending order.  
**Type** `bool`

**fieldPath**  
Path of the data field to be indexed.  
**Type** `str`

**function**  
To be defined.  
**Type** `str`

### 1.3.2.6 ExportedKeyFile

```
class il2_rest.models.ExportedKeyFile (keyFileBytes=None, keyFileName=None, key-  
Name=None, **kwargs)  
    Bases: il2_rest.models.BaseModel  
    Key file info.  
    keyFileBytes  
        Key file in bytes.  
        Type bytes  
    keyFileName  
        Filename of the key.  
        Type str  
    keyName  
        Name of the key.  
        Type str
```

### 1.3.2.7 ChainIdModel

```
class il2_rest.models.ChainIdModel (chain_id=None, name=None, licensingStatus=None,  
**kwargs)  
    Bases: il2_rest.models.BaseModel  
    Chain Id  
    id  
        Unique record id.  
        Type str  
    name  
        Chain name.  
        Type str  
    licensingStatus  
        Licensing status.  
        Type str  
    __eq__ (other)  
        bool: Return self.id == other.id.  
    __hash__ ()  
        int: Hash representation of self.  
    __lt__ (other)  
        bool: Return self.id < other.id.  
    __str__ ()  
        str: String representation of the ChainIdModel.
```

### 1.3.2.8 ChainCreatedModel

```
class il2_rest.models.ChainCreatedModel (chain_id=None, name=None, keyFiles=[],
                                         **kwargs)
    Bases: il2_rest.models.ChainIdModel
    Chain created response.

    id
        Unique record id.
        Type str

    keyFiles
        Emergency key file names.
        Type list of ExportedKeyFile

    name
        Chain name.
        Type str
```

### 1.3.2.9 ChainCreationModel

```
class il2_rest.models.ChainCreationModel (name, emergencyClosingKeyPassword,
                                           managementKeyPassword, additionalApps=None, description=None, emergencyClosingKeyStrength=<KeyStrength.ExtraStrong: 'ExtraStrong'>, managementKeyStrength=<KeyStrength.Strong: 'Strong'>, keysAlgorithm=<Algorithms.RSA: 'RSA'>, operatingKeyStrength=<KeyStrength.Normal: 'Normal'>, parent=None, **kwargs)
    Bases: il2_rest.models.BaseModel
    Chain creation parameters.

    additionalApps
        List of additional apps (only numeric ids).
        Type list of int

    description
        Description (perhaps intended primary usage).
        Type str

    emergencyClosingKeyPassword
        Emergency closing key password.
        Type str

    emergencyClosingKeyStrength
        Emergency closing key strength of key.
        Type il2_rest.enumerations.KeyStrength

    managementKeyPassword
        Key management key password.
        Type str
```

**managementKeyStrength**

Key management strength of key.

**Type** `il2_rest.enumerations.KeyStrength`

**keysAlgorithm**

Keys algorithm.

**Type** `il2_rest.enumerations.Algorithms`

**name**

Name of the chain.

**Type** `str`

**operatingKeyStrength**

Operating key strength of key.

**Type** `il2_rest.enumerations.KeyStrength`

**parent**

Parent record Id.

**Type** `str`

### 1.3.2.10 ChainSummaryModel

```
class il2_rest.models.ChainSummaryModel (chain_id=None, name=None, activeApps=[],  
                                         description=None, isClosedForNewTransactions=False, lastRecord=None, **kwargs)
```

Bases: `il2_rest.models.ChainIdModel`

Chain summary.

**activeApps**

List of active apps (only the numeric ids).

**Type** `list of int`

**description**

Description (perhaps intended primary usage).

**Type** `str`

**isClosedForNewTransactions**

Indicates if the chain accepts new records.

**Type** `bool`

**lastRecord**

Serial number of the last record.

**Type** `int`

### 1.3.2.11 DocumentUploadConfigurationModel

```
class il2_rest.models.DocumentUploadConfigurationModel (defaultCompression=None,
                                                         defaultEncryption=None,
                                                         fileSizeLimit=None,      it-
                                                         erations=None,      permit-
                                                         tedContentTypes=None,
                                                         timeOutInMinutes=None,
                                                         **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Node configuration of uploaded documents.

#### Parameters

- **defaultCompression** (`str`) – Default compression algorithm.
- **defaultEncryption** (`str`) – Default encryption algorithm.
- **fileSizeLimit** (`int`) – Maximum file size.
- **iterations** (`int`) – Default number of PBE iterations to generate the key.
- **permittedContentTypes** (list of `str`) – List of content types mime-type/extension.
- **timeOutInMinutes** (`int`) – Timeout in minutes.

#### **defaultCompression**

Default compression algorithm.

**Type** `str`

#### **defaultEncryption**

Default encryption algorithm.

**Type** `str`

#### **fileSizeLimit**

Maximum file size.

**Type** `int`

#### **iterations**

Default number of PBE iterations to generate the key.

**Type** `int`

#### **permittedContentTypes**

List of content types mime-type/extension.

**Type** list of `str`

#### **timeOutInMinutes**

Timeout in minutes.

**Type** `int`

### 1.3.2.12 DocumentsBeginTransactionModel

```
class il2_rest.models.DocumentsBeginTransactionModel(chain, comment=None, en-  
                                                    ryption=None, compres-  
                                                    sion=None, generatePub-  
                                                    licDirectory=None, itera-  
                                                    tions=None, password=None,  
                                                    **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Parameters for starting a transaction to store many documents in a single InterlockLedger record.

#### Parameters

- **chain** (`str`) – Id of the chain where the set of documents should be stored.
- **comment** (`str`) – Any additional information about the set of documents to be stored.
- **compression** (`il2_rest.enumerations.DocumentsCompression`) – Compression algorithm.
- **encryption** (`str`) – The encryption descriptor in the <pbe>-<hash>-<cipher>-<level> format
- **generatePublicDirectory** (`bool`) – If the publically viewable PublicDirectory field should be created.
- **iterations** (`int`) – Override for the number of PBE iterations to generate the key.
- **password** (`bytes`) – Password as bytes if Encryption is not null.

#### chain

Id of the chain where the set of documents should be stored.

**Type** `str`

#### comment

Any additional information about the set of documents to be stored.

**Type** `str`

#### compression

Compression algorithm. The compression algorithm can be as follows:

- NONE: No compression. Simply store the bytes;
- GZIP: Compression of the data using the gzip standard;
- BROTLI: Compression of the data using the brotli standard;
- ZSTD: Compression of the data using the ZStandard from Facebook (In the future).

**Type** `il2_rest.enumerations.DocumentsCompression`

#### encryption

The encryption descriptor in the <pbe>-<hash>-<cipher>-<level> format. Examples:

- “PBKDF2-SHA256-AES256-LOW”
- “PBKDF2-SHA512-AES256-MID”
- “PBKDF2-SHA256-AES128-HIGH”

**Type** `str`

**generatePublicDirectory**

If the publically viewable PublicDirectory field should be created.

**Type** bool

**iterations**

Override for the number of PBE iterations to generate the key.

**Type** int

**password**

Password as bytes if Encryption is not null.

**Type** bytes

**1.3.2.13 DocumentsMetadataModel**

```
class il2_rest.models.DocumentsMetadataModel (comment=None,      compression=None,
                                              encryption=None,      encryptionParam-
                                              eters=None,           eters=None,
                                              publicDirectory=None,
                                              **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Metadata associated to a Multi-Document Storage Locator.

**Parameters**

- **comment** (str) – Any additional information about this set of documents
- **compression** (str) – Compression algorithm.
- **encryption** (str) – The encryption descriptor in the <pbe>-<hash>-<cipher>-<level> format.
- **encryptionParameters** (list of `EncryptionParameters`/list of str) – The parameters used to make the encryption of the set of documents.
- **publicDirectory** (`DirectoryEntry`/str) – List of stored documents.

**comment**

Any additional information about this set of documents

**Type** str

**compression**

Compression algorithm.

**Type** str

**encryption**

The encryption descriptor in the <pbe>-<hash>-<cipher>-<level> format.

**Type** str

**encryptionParameters**

The parameters used to make the encryption of the set of documents.

**Type** list of `EncryptionParameters`

**publicDirectory**

List of stored documents.

**Type** `DirectoryEntry`

```
class DirectoryEntry (name=None, comment=None, mimeType=None, **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Entry for each stored document in this MultiDocument set

**name**

Document file name.

**Type** str

**iterations**

Any provided additional information about the document file.

**Type** str

**mimeType**

Mime Type for the document content

**Type** str

```
class EncryptionParameters (iterations=None, salt=None, **kwargs)
```

Bases: `il2_rest.models.BaseModel`

The parameters used to make the encryption of the set of documents.

**iterations**

Number of iterations to generate the key.

**Type** str

**salt**

Salt value to feed the cypher engine.

**Type** str

#### 1.3.2.14 ForceInterlockModel

```
class il2_rest.models.ForceInterlockModel (hashAlgorithm=<HashAlgorithms.SHA256:  
                                          'SHA256'>, minSerial=0, targetChain=None,  
                                          **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Force interlock command details.

**hashAlgorithm**

Hash algorithm to use.

**Type** `il2_rest.enumerations.HashAlgorithms`

**minSerial**

Required minimum of the serial of the last record in target chain whose hash will be pulled.

**Type** int

**targetChain**

Id of chain to be interlocked.

**Type** str

**\_\_str\_\_** ()

(str): String representation of the interlock.

### 1.3.2.15 KeyModel

```
class il2_rest.models.KeyModel (key_id=None, name=None, permissions=None, publicKey=None, purposes=None, **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Key model

#### Parameters

- **key\_id** (`str`) – Unique key id.
- **name** (`str`) – Key name.
- **permissions** (list of `AppPermissions`) – List of Apps and Corresponding Actions to be permitted by numbers.
- **publicKey** (`str`) – Key public key.
- **purposes** (list of `il2_rest.enumerations.KeyPurpose`/`str`) – Key valid purposes.
- **\*\*kwargs** – Arbitrary keyword arguments.

#### **id**

Unique key id.

**Type** `str`

#### **name**

Key name.

**Type** `str`

#### **permissions**

List of Apps and Corresponding Actions to be permitted by numbers.

**Type** list of `AppPermissions`

#### **publicKey**

Key public key.

**Type** `str`

#### **purposes**

Key valid purposes.

**Type** list of `il2_rest.enumerations.KeyPurpose`/`str`

#### **\_\_str\_\_()**

(`str`): String representation of the key details.

#### **property actionable**

Return True if 'Action' is in the list of purposes.

**Type** (`bool`)

### 1.3.2.16 KeyPermitModel

```
class il2_rest.models.KeyPermitModel (key_id=None,    name=None,    permissions=None,  
                                     publicKey=None,  purposes=[],  app=None,  ap-  
                                     pActions=None, **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Key to permit.

#### Parameters

- **key\_id** (str) – Unique key id.
- **name** (str) – Key name.
- **permissions** (list of `AppPermissions`) – List of Apps and Corresponding Actions to be permitted by numbers.
- **publicKey** (str) – Key public key.
- **purposes** (list of `il2_rest.enumerations.KeyPurpose`/str) – Key valid purposes.
- **app** (int) – App to be permitted (by number). *Note:* If app and appActions is passed as parameter, permissions parameter will be ignored.
- **appActions** (list of int) – App actions to be permitted by number. *Note:* If app and appActions is passed as parameter, permissions parameter will be ignored.
- **\*\*kwargs** – Arbitrary keyword arguments.

#### **id**

Unique key id.

**Type** str

#### **name**

Key name.

**Type** str

#### **permissions**

List of Apps and Corresponding Actions to be permitted by numbers.

**Type** list of `AppPermissions`

#### **publicKey**

Key public key.

**Type** str

#### **purposes**

Key valid purposes.

**Type** list of `il2_rest.enumerations.KeyPurpose`/str

### 1.3.2.17 NewRecordModelBase

```
class il2_rest.models.NewRecordModelBase (applicationId=None,
                                           rec_type=<RecordType.Data: 'Data'>,
                                           **kwargs)

Bases: il2_rest.models.BaseModel

Base model for new Record.

applicationId
    Application id this record is associated with.

    Type int

rec_type
    Block type. Most records are of the type 'Data'. Corresponds to the 'type' field in the JSON.

    Type il2_rest.enumerations.RecordType
```

### 1.3.2.18 NewRecordModelAsJson

```
class il2_rest.models.NewRecordModelAsJson (applicationId=None,
                                              rec_type=<RecordType.Data: 'Data'>,
                                              rec_json=None, payloadTagId=None,
                                              **kwargs)

Bases: il2_rest.models.NewRecordModelBase

New record model to be added to the chain as a JSON.

JSON
    The payload data matching the metadata for PayloadTagId.

    Type dict

payloadTagId
    The tag id for the payload, as registered for the application.

    Type il2_rest.enumerations.RecordType

property to_query_string
    Request query representation.

    Type (str)
```

### 1.3.2.19 NewRecordModel

```
class il2_rest.models.NewRecordModel (applicationId=None, rec_type=<RecordType.Data:
                                         'Data'>, payloadBytes=None, **kwargs)

Bases: il2_rest.models.NewRecordModelBase

New record model to be added to the chain as raw bytes.

payloadBytes
    The payload in bytes. Must match the bytes schema of the application Id.

    Type dict
```

### 1.3.2.20 NodeCommonModel

```
class il2_rest.models.NodeCommonModel (color=None, node_id=None, name=None, network=None, ownerId=None, ownerName=None, roles=None, softwareVersions=None, **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Node/Peer common details

**color**

Mapping color.

**Type** `Color`

**id**

Unique node id

**Type** `str`

**name**

Node name.

**Type** `str`

**network**

Network this node participates on.

**Type** `str`

**ownerId**

Node owner id

**Type** `str`

**ownerName**

Node owner name.

**Type** `str`

**roles**

List of active roles running in the node

**Type** `list of str`

**softwareVersions**

Version of software running the Node.

**Type** `Versions`

**property fancy\_color**

Return the color as its name or the corresponding hexadecimal values.

**Type** `(str)`

### 1.3.2.21 NodeDetailsModel

```
class il2_rest.models.NodeDetailsModel (color=None, node_id=None, name=None, network=None, ownerId=None, ownerName=None, roles=None, softwareVersions=None, chains=[], **kwargs)
```

Bases: `il2_rest.models.NodeCommonModel`

Node details

**chains**

List of owned records, only the ids

**Type** list of str

### 1.3.2.22 PeerModel

```
class il2_rest.models.PeerModel (color=None, node_id=None, name=None, network=None, ownerId=None, ownerName=None, roles=None, softwareVersions=None, address=None, port=None, protocol=None, **kwargs)
```

Bases: `il2_rest.models.NodeCommonModel`

Peer details.

**address**

Network address to contact the peer.

**Type** str

**port**

Port the peer is listening.

**Type** int

**protocol**

Network protocol the peer is listening.

**Type** `il2_rest.enumerations.NetworkProtocol`

### 1.3.2.23 RecordModelBase

```
class il2_rest.models.RecordModelBase (applicationId=None, chainId=None, createdAt=None, rec_hash=None, payloadTagId=None, serial=None, rec_type=None, version=None, reference=None, network=None, **kwargs)
```

Bases: `il2_rest.models.BaseModel`

Base model for records.

**Parameters**

- **applicationId** (int) – Application id this record is associated with.
- **chainId** (str) – Chain id that owns this record.
- **createdAt** (datetime.datetime/str) – Time of record creation. If a string is passed, it will be automatically converted to datetime.datetime, as long as the string is in the 'yyyy-mm-ddTHH:MM:SS+HH:MM' format.
- **rec\_hash** (str) – Hash of the full encoded bytes of the record.

- **payloadTagId**(int) – The payload’s TagId.
- **serial**(int) – Block serial number. For the first record this value is zero (0).
- **rec\_type**(*il2\_rest.enumerations.RecordType*) – Block type. Most records are of the type ‘Data’. Corresponds to the ‘type’ field in the JSON.
- **version**(int) – Version of this record structure.
- **network**(str) – Network name this chain is part.
- **reference**(str) – Universal reference of this record.

**applicationId**

Application id this record is associated with.

**Type** int

**chainId**

Chain id that owns this record.

**Type** str

**createdAt**

Time of record creation.

**Type** datetime.datetime

**hash**

Hash of the full encoded bytes of the record.

**Type** str

**payloadTagId**

The payload’s TagId.

**Type** int

**serial**

Block serial number. For the first record this value is zero (0).

**Type** int

**type**

Block type. Most records are of the type ‘Data’. Corresponds to the ‘type’ field in the JSON.

**Type** *il2\_rest.enumerations.RecordType*

**version**

Version of this record structure.

**Type** int

**network**

Network name this chain is part.

**Type** str

**reference**

Universal reference of this record.

**Type** str

**\_\_str\_\_()**

(str): JSON representation of the record as string.

### 1.3.2.24 RecordModel

```
class il2_rest.models.RecordModel (applicationId=None, chainId=None, createdAt=None,
                                     rec_hash=None, payloadTagId=None, serial=None,
                                     rec_type=None, version=None, reference=None, net-
                                     work=None, payloadBytes=None, **kwargs)
```

Bases: `il2_rest.models.RecordModelBase`

Generic opaque record.

**Parameters** **payloadBytes** (bytes/str) – The payload’s bytes. If loaded from JSON, can be input as a base64 string which will be decoded to bytes.

**payloadBytes**

The payload’s bytes.

**Type** bytes

### 1.3.2.25 RecordModelAsJson

```
class il2_rest.models.RecordModelAsJson (applicationId=None, chainId=None, create-
                                             dAt=None, rec_hash=None, payloadTagId=None,
                                             serial=None, rec_type=None, version=None,
                                             reference=None, network=None, payload=None,
                                             **kwargs)
```

Bases: `il2_rest.models.RecordModelBase`

Record model as JSON.

**payload**

Payload bytes.

### 1.3.2.26 InterlockingRecordModel

```
class il2_rest.models.InterlockingRecordModel (applicationId=None, chainId=None,
                                                  createdAt=None, rec_hash=None,
                                                  payloadTagId=None, serial=None,
                                                  rec_type=None, version=None, refer-
                                                  ence=None, network=None, payload-
                                                  Bytes=None, interlockedChainId=None,
                                                  interlockedRecordHash=None, inter-
                                                  lockedRecordOffset=None, interlocke-
                                                  dRecordSerial=None, **kwargs)
```

Bases: `il2_rest.models.RecordModel`

Interlocking details.

**interlockedChainId**

Interlocked Chain.

**Type** str

**interlockedRecordHash**

Interlock Record Hash.

**Type** str

**interlockedRecordOffset**

Interlocked Record Offset.

**Type** `int`

**interlockedRecordSerial**  
Interlocked Record Serial.

**Type** `int`

**\_\_str\_\_()**  
(`str`): String representation.

### 1.3.2.27 JsonDocumentRecordModel

**class** `il2_rest.models.JsonDocumentRecordModel` (`applicationId=None`, `chainId=None`,  
`createdAt=None`, `rec_hash=None`,  
`payloadTagId=None`, `serial=None`,  
`rec_type=None`, `version=None`, `reference=None`, `network=None`, `json-Text=None`,  
`encryptedJson=None`,  
`**kwargs`)

Bases: `il2_rest.models.RecordModelBase`

Record to store JSON documents.

**jsonText**  
JSON document as string.

**Type** `str`

**encryptedJson**  
JSON Documents encrypted text.

**Type** `EncryptedTextModel`

### 1.3.2.28 EncryptedTextModel

**class** `il2_rest.models.EncryptedTextModel` (`cipher=None`, `cipherText=None`, `readingKeys=None`,  
`**kwargs`)

Bases: `il2_rest.models.BaseModel`

JSON Documents encrypted text.

**cipher**  
Cipher algorithm used to cipher the text.

**Type** `il2_rest.enumerations.CipherAlgorithms`

**cipherText**  
Encrypted text.

**Type** `str`

**readingKeys**  
List of keys able to read this encrypted text.

**Type** `list of ReadiReadingKeyModel`

**decode\_with** (`certificate`)  
Decode the encrypted JSON Document text using the keys inside the certificate.

**Parameters** **certificate** (`il2_rest.util.PKCS12Certificate`) – PKCS12 certificate with the keys to decode the text.

**Returns** Decoded JSON.

**Return type** dict

### Example

```
>>> node = RestNode(cert_file=cert_path, cert_pass=cert_pass, address=address,
↳port =port_number)
>>> chain = node.chains[0]
>>> json_body = {"attribute_1": "value_1", "number_1": 1}
>>> response = chain.store_json_document(json_body)
>>> pkcs12_cert = PKCS12Certificate(path=cert_path, password = cert_pass)
>>> response_json = response.encryptedJson.decode_with(pkcs12_cert)
>>> print(response_json)
{"attribute_1": "value_1", "number_1": 1}
```

### 1.3.2.29 ReadingKeyModel

**class** `il2_rest.models.ReadingKeyModel` (*encryptedIV=None, encryptedKey=None, publicKey-Hash=None, readerId=None, \*\*kwargs*)

Bases: `il2_rest.models.BaseModel`

Keys able to read an encrypted JSON Document record.

**encryptedIV**

Encrypted AES256 IV.

**Type** str

**encryptedKey**

Encrypted AES256 key.

**Type** str

**publicKeyHash**

Public key hash in IL2 text representation.

**Type** str

**readerId**

Id of the key.

**Type** str

### 1.3.2.30 Versions

**class** `il2_rest.models.Versions` (*coreLibs=None, main=None, peer2peer=None, tags=None, \*\*kwargs*)

Bases: `il2_rest.models.BaseModel`

Versions for parts of the software.

**coreLibs**

Core libraries and il2apps version.

**Type** str

**main**

Interlockledger node daemon version.

**Type** str

**peer2peer**  
Peer2Peer connectivity library version.

**Type** str

**tags**  
Tag-Length-Value library version.

**Type** str

### 1.3.2.31 PageOfModel

**class** `il2_rest.models.PageOfModel` (*items=None, page=None, pageSize=None, totalNumberOfPages=None, itemClass=None, \*\*kwargs*)  
Bases: `il2_rest.models.BaseModel`

## 1.3.3 Enumerations module

Enumerations used in the InterlockLedger REST API.

### 1.3.3.1 Algorithms

**class** `il2_rest.enumerations.Algorithms` (*value*)  
Bases: `il2_rest.enumerations.AutoName`  
Enumeration of the digital signature algorithms available in IL2.

**DSA** = 'DSA'  
**EcDSA** = 'EcDSA'  
**EdDSA** = 'EdDSA'  
**ElGamal** = 'ElGamal'  
**RSA** = 'RSA'  
**RSA15** = 'RSA15'

### 1.3.3.2 AutoName

**class** `il2_rest.enumerations.AutoName` (*value*)  
Bases: `enum.Enum`  
Base Enum class to automatically generate the enumerations values based on the enumeration name.

### 1.3.3.3 DataFieldCast

```
class il2_rest.enumerations.DataFieldCast (value)  
    Bases: il2_rest.enumerations.AutoName  
  
    Enumeration of casting options for DataField  
  
    DateTime = 'DateTime'  
  
    Integer = 'Integer'  
  
    NONE = 'None'  
  
    TimeSpan = 'TimeSpan'
```

### 1.3.3.4 CipherAlgorithms

```
class il2_rest.enumerations.CipherAlgorithms (value)  
    Bases: il2_rest.enumerations.AutoName  
  
    Enumeration of the cipher algorithms available in IL2.  
  
    AES256 = 'AES256'  
  
    NONE = 'None'
```

### 1.3.3.5 HashAlgorithms

```
class il2_rest.enumerations.HashAlgorithms (value)  
    Bases: il2_rest.enumerations.AutoName  
  
    Enumeration of the hash algorithms available in IL2.  
  
    Copy = 'Copy'  
  
    SHA1 = 'SHA1'  
  
    SHA256 = 'SHA256'  
  
    SHA3_256 = 'SHA3_256'  
  
    SHA3_512 = 'SHA3_512'  
  
    SHA512 = 'SHA512'
```

### 1.3.3.6 KeyPurpose

```
class il2_rest.enumerations.KeyPurpose (value)  
    Bases: il2_rest.enumerations.AutoName  
  
    Enumeration of the purpose of keys in IL2.  
  
    Action = 'Action'  
  
    ChainOperation = 'ChainOperation'  
  
    ClaimSigner = 'ClaimSigner'  
  
    Encryption = 'Encryption'  
  
    ForceInterlock = 'ForceInterlock'  
  
    InvalidKey = 'InvalidKey'
```

```
KeyManagement = 'KeyManagement'  
Protocol = 'Protocol'
```

### 1.3.3.7 KeyStrength

```
class il2_rest.enumerations.KeyStrength(value)  
    Bases: il2_rest.enumerations.AutoName  
    Enumeration of the strength of keys.  
  
    Normal = 'Normal'  
        RSA 2048  
  
    Strong = 'Strong'  
        RSA 3072  
  
    ExtraStrong = 'ExtraStrong'  
        RSA 4096  
  
    MegaStrong = 'MegaStrong'  
        RSA 5120  
  
    SuperStrong = 'SuperStrong'  
        RSA 6144  
  
    HyperStrong = 'HyperStrong'  
        RSA 7172  
  
    UltraStrong = 'UltraStrong'  
        RSA 8192
```

### 1.3.3.8 NetworkProtocol

```
class il2_rest.enumerations.NetworkProtocol(value)  
    Bases: il2_rest.enumerations.AutoName  
    Enumeration of the network protocols.  
  
    HTTPS_Proxied = 'HTTPS_Proxied'  
  
    Originator_Only = 'Originator_Only'  
  
    TCP_Direct = 'TCP_Direct'  
  
    TCP_Proxied = 'TCP_Proxied'
```

### 1.3.3.9 NetworkPredefinedPorts

```
class il2_rest.enumerations.NetworkPredefinedPorts(value)  
    Bases: enum.IntEnum  
    Enumeration of the default ports of the IL2 networks.  
  
    MainNet = 32032  
  
    MetaNet = 32036  
  
    TestNet_Apollo = 32020  
  
    TestNet_Janus = 32022
```

```
TestNet_Jupiter = 32030
TestNet_Liber = 32018
TestNet_Minerva = 32024
TestNet_Neptune = 32026
TestNet_Saturn = 32028
```

#### 1.3.3.10 RecordType

```
class il2_rest.enumerations.RecordType(value)
    Bases: il2_rest.enumerations.AutoName
    Enumeration of the types of Records available in IL2.
    Closing = 'Closing'
    Corrupted = 'Corrupted'
    Data = 'Data'
    EmergencyClosing = 'EmergencyClosing'
    Root = 'Root'
```

#### 1.3.3.11 DocumentsCompression

```
class il2_rest.enumerations.DocumentsCompression(value)
    Bases: il2_rest.enumerations.AutoName
    Enumeration of the compression algorithm.
    BROTLI = 'BROTLI'
    GZIP = 'GZIP'
    NONE = 'NONE'
    ZSTD = 'ZSTD'
```

### 1.3.4 Util module

Utility classes and functions for the InterlockLedger REST API.

#### 1.3.4.1 LimitedRange

```
class il2_rest.util.LimitedRange(start, count=1, end=None)
    Bases: object
```

A closed interval of integers represented by the notation '[start-end]'. If the range has only one value, the range is represented by '[start]'.

##### Parameters

- **start** (int) – Initial value of the interval
- **count** (int, optional) – How many elements are in the range
- **end** (int, optional) – If defined, define the end value of the interval

**Raises** **ValueError** – If ‘count’ is 0

**start**  
Initial value of the interval

**Type** `int`

**end**  
End value of the interval

**Type** `int`

**\_\_contains\_\_** (*item*)  
Check if item is in self.

**Parameters** **item** (`int`/*LimitedRange*) – Item to check if is in self.

**Returns** Return item in self.

**Return type** `bool`

**\_\_eq\_\_** (*other*)  
`bool`: Return self == other.

**\_\_hash\_\_** ()  
`int`: Hash representation of self.

**\_\_str\_\_** ()  
`str`: String representation of self.

**property count**  
Number of elements in the interval.

**Type** `int`

**overlaps\_with** (*other*)  
Check if there is an overlap between the intervals of self and other.

**Returns** Return True if there is an overlap.

**Return type** `bool`

**classmethod resolve** (*text*)  
Parses a string into a *LimitedRange*.

**Parameters** **text** (`str`) – String representing the range in the format of ‘[start]’ or ‘[start-end]’.

**Returns** An instance of the *LimitedRange* represented by the *text*.

**Return type** *LimitedRange*

#### 1.3.4.2 PKCS12Certificate

**class** `il2_rest.util.PKCS12Certificate` (*path, password*)  
Bases: `object`  
A PKCS12 certificate interface.

**Parameters**

- **path** (`str`) – Path to the .pfx certificate.
- **password** (`str`) – Password of the .pfx certificate.

**decrypt** (*cypher\_text*)

Decode a encrypted message using RSA with SHA1.

**Parameters** **cypher\_text** (*bytes*) – Encrypted message.

**Returns** Decrypted message.

**Return type** *bytes*

**property friendly\_name**

Certificate friendly name (Not implemented).

**Type** *str*

**has\_pk** ()

Check if the certificate has a primary key.

**Returns** True if the certificate has a primary key.

**Return type** *bool*

**property key\_id**

Id of the key.

**Type** *str*

**property private\_key**

Certificate private key.

**Type** *bytes*

**property pub\_key\_hash**

Public key hash in IL2 text representation.

**Type** *str*

**property public\_certificate**

Certificate public certificate.

**Type** *bytes*

**property public\_exponent**

Public exponent.

**Type** *int*

**property public\_modulus**

Public modulus.

**Type** *int*

### 1.3.4.3 null\_condition\_attribute

**il2\_rest.util.null\_condition\_attribute** (*obj, attribute*)

Return the value of the item with key equals to attribute.

**Parameters**

- **obj** (*dict*) – Dictionary object.
- **attribute** (*str*) – Attribute name of obj.

**Returns** The value of the item. If obj is None, return None.

#### 1.3.4.4 filter\_none

`il2_rest.util.filter_none(d)`

Remove items of a dictionary with None values.

**Parameters** `d(dict)` – Dictionary object.

**Returns** Dictionary without None items.

**Return type** `dict`

#### 1.3.4.5 string2datetime

`il2_rest.util.string2datetime(time_string)`

Convert a string to datetime object. The format of the string is as follows: 'yyyy-mm-ddTHH:MM:SS+HH:MM'.

**Parameters** `time_string(str)` – string with date and time.

**Returns** date time object.

**Return type** `datetime.datetime`

#### 1.3.4.6 to\_bytes

`il2_rest.util.to_bytes(value)`

Decodes value to bytes.

**Parameters** `value` – Value to decode to bytes

**Returns**

Return the value as bytes:

- if `type(value)` is `bytes`, return `value`;
- if `type(value)` is `str`, return the string encoded with UTF-8;
- otherwise, returns `bytes(value)`.

**Return type** `bytes`

#### 1.3.4.7 build\_query

`il2_rest.util.build_query(args_names, args_values)`

Transform a list of names and values in a HTTP query string.

**Parameters**

- **`args_names`** (`list` of `str`) – List of names.
- **`args_values`** (`list`) – List of values, must have same length of `args_names`.

**Returns** Query string.

**Return type** `str`

## ABOUT THIS DOCUMENTATION

This reference manual was partially created using Sphinx and Google style docstrings. If you need/want to create this manual in another format (HTML, man, etc), you will need to install Sphinx and Sphinx-Napoleon extension:

```
$ pip3 install --user sphinx sphinxcontrib-napoleon2
```

To create an HTML version you can use the following instructions:

```
$ cd docs/  
$ make html
```

To create the PDF version you can use the following instructions:

```
$ cd docs/  
$ make latexpdf
```

---

**Note:** To create the PDF version, you must have a LaTeX builder (default is `pdflatex`) installed.

---
